

Statistical bulletin

Crime in England and Wales: year ending December 2017

Crime against households and adults, also including data on crime experienced by children, and crimes against businesses and society.

1 . Main points

While crime has fallen over the long-term, the short-term picture is more stable with most types of crime staying at similar levels to 2016. It is too early to say whether this indicates a change to the overall trend or simply a pause, which has happened before. The exceptions to this stable picture are rises in some types of theft and in lower-volume but higher-harm types of violence, and a fall in the high-volume offence of computer misuse.

As these figures cover a broad range of crime types and there is variation in the trends by crime type, it is better to consider the different types individually to understand these changes.

A fall in crime estimated by the Crime Survey for England and Wales (CSEW) was mainly driven by a 28% decrease in computer misuse offences, largely due to a decline in computer viruses.

For offences that are well recorded by the police, police recorded crime data provide insight into areas that the survey does not cover well. These include the less frequent but higher-harm violent offences, which showed rises:

- a 22% increase in offences involving knives or other sharp instruments
- an 11% increase in firearms offences

These offences tend to be disproportionately concentrated in London and other metropolitan areas.

There was also evidence of a rise in vehicle-related theft offences, with the latest CSEW estimates showing a 17% increase compared with the previous year. This is consistent with rises seen in the number of vehicle-related theft offences recorded by the police.

Police figures also indicate a rise in burglary (9% increase), which is thought to reflect a genuine increase in this type of crime.

To put these figures into context, most people do not experience crime. In the year ending December 2017, 8 in 10 adults were not a victim of any of the crimes asked about in the CSEW.

Many of the findings reported in this bulletin are consistent with those reported in the year ending September 2017 bulletin, released in January 2018.

Important points for interpreting figures in this bulletin

- An increase in the number of crimes recorded by the police does not necessarily mean the level of crime has increased.
- For many types of crime, police recorded crime statistics do not provide a reliable measure of levels or trends in crime.
- They only cover crimes that come to the attention of the police and can be affected by changes in policing activity and recording practice and by willingness of victims to report.
- The CSEW does not cover crimes against businesses or those not resident in households and is not well-suited to measuring trends in some of the more harmful crimes that occur in relatively low volumes.
- For offences that are well recorded by the police, police figures provide a useful supplement to the survey and provide insight into areas that the survey does not cover well.

2 . Latest figures

A summary of what the latest figures show for different crime types, using the most appropriate data source for each, is given in Table 1. More detailed analysis by crime type is provided in sections 6 to 12 of this bulletin.

Table 1: What do the latest figures show?

	Figures for year ending December 2017	Things to note
Burglary	9% increase in police recorded offences (to 438,971)	Burglary offences are thought to be relatively well reported by the public and relatively well recorded by the police and so the increase in police recorded burglary is likely to reflect a genuine increase. There was no change in burglary measured by the Crime Survey for England and Wales (CSEW), but if the increase continues, we would expect this to show up in the survey in due course.
Computer misuse	28% decrease in offences estimated by the CSEW (to 1,374,000)	Falls in computer misuse crimes were the main driver of the overall decrease in crime estimated by the CSEW. Reports to Action Fraud show an increase in computer misuse offences, but these data cannot be compared with the CSEW estimates as they reflect only a small fraction of all computer misuse and include offences against businesses.
Fraud	No change in offences estimated by the CSEW (3,241,000)	The CSEW provides the best indication of the overall trend in fraud as it captures the lower-harm cases that are more frequent but less likely to have been reported to the authorities.
Homicide	9% increase in police recorded offences (to 653 – excluding terrorist attacks in London and Manchester and events at Hillsborough in 1989)	The recent trend is affected by exceptional events with multiple homicide victims. While deaths resulting from the terrorist attacks and events at Hillsborough are included in the latest homicide figures, the figures presented in this table exclude these victims to provide a comparison on a more consistent basis. When the victims of these events are included in the figures, there was a 1% decrease in homicides recorded by the police (to 688).
Robbery	33% increase in police recorded offences (to 74,130)	Recording improvements are likely to have contributed to this rise, but the impact is thought to be less pronounced than for other crime types. Therefore, the increase may also reflect an element of a real change in these crimes. The CSEW does not provide a robust measure of short-term trends in robbery as it is a relatively low-volume crime.
Vehicle-related theft	17% increase in offences estimated by the CSEW (to 929,000)	A 16% increase was also seen in vehicle offences recorded by the police (to 452,683), continuing the rising trend seen over the last two years. Vehicle offences are thought to be relatively well reported by the public and well recorded by the police.
Violence	<p>No change in overall violent offences estimated by the CSEW (1,245,000)</p> <p>22% increase in police recorded knife or sharp instrument offences (to 39,598 offences)</p> <p>11% increase in police recorded firearms offences (to 6,604 offences)</p>	The CSEW provides the better measure of trends in overall violent crime, covering the more common but less harmful offences. Police recorded crime provides a better measure of the more harmful but less common violent offences that are not well measured by the survey because of their relatively low volume. These offences are thought to be relatively well recorded by the police.

Source: Office for National Statistics

3 . Statistician's comment

"Today's figures show that, for most types of offence, the picture of crime has been fairly stable, with levels much lower than the peak seen in the mid-1990s. Eight in ten adults had not experienced any of the crimes asked about in our survey in the latest year.

"However, we have seen an increase in the relatively rare, but "high-harm" violent offences such as homicide, knife crime and gun crime, a trend that has been emerging over the previous two years. We have also seen evidence that increases in some types of theft have continued, in particular vehicle-related theft and burglary."

Alexa Bradley, Crime Statistics and Analysis, Office for National Statistics

4 . Things you need to know about this release

Sources included

This bulletin primarily reports on data from two main sources of crime data: the Crime Survey for England and Wales (CSEW) and police recorded crime. More information on both these sources can be found in the [User guide to crime statistics for England and Wales](#).

Crime Survey for England and Wales

The Crime Survey for England and Wales (CSEW) is a face-to-face victimisation survey in which people resident in households in England and Wales are asked about their experiences of a selected range of offences in the 12 months prior to the interview. More information on the methodology can be found in the [Crime in England and Wales Quality and Methodology Information report](#).

The CSEW does not cover all crimes. It does not cover crimes against businesses or those not resident in households (for example, people living in institutions or short-term visitors). The CSEW is also not well-suited to measuring trends in some of the more harmful crimes that occur in relatively low volumes. For example, there were around four cases of robbery per 1,000 people estimated by the CSEW in the last year. As the CSEW sample size is relatively small in terms of very low volume crimes, estimates of less frequently-occurring crime types can be subject to substantial variability making it difficult to detect short-term trends.

All changes reported in this bulletin, based on the CSEW, are statistically significant at the 5% level unless stated otherwise.

Police recorded crime

The other main source used in this bulletin is the number of crimes reported to and recorded by the police. These figures are principally a measure of the level of police activity related to crime and are useful in assessing how caseload has changed both in volume and nature over time.

Due to concerns over the quality and consistency of crime recording practice, police recorded crime data were assessed against the Code of Practice for Official Statistics (now the Code of Practice for Statistics) and found not to meet the required standard for designation as National Statistics¹.

The National Statistics status of statistics about unlawful deaths based on the Homicide Index² was [restored](#) in December 2016.

Information on why these two main data sources can sometimes show differing trends is published in the methodological note [Why do the two data sources show differing trends?](#) and more information is available in the [User Guide to Crime Statistics for England and Wales](#).

Time periods covered

The latest CSEW figures presented in this release are based on interviews conducted between January 2017 and December 2017, measuring peoples' experiences of crime in the 12 months before the interview.

The latest recorded crime figures relate to crimes recorded by the police during the year ending December 2017 (between January 2017 and December 2017).

In this release:

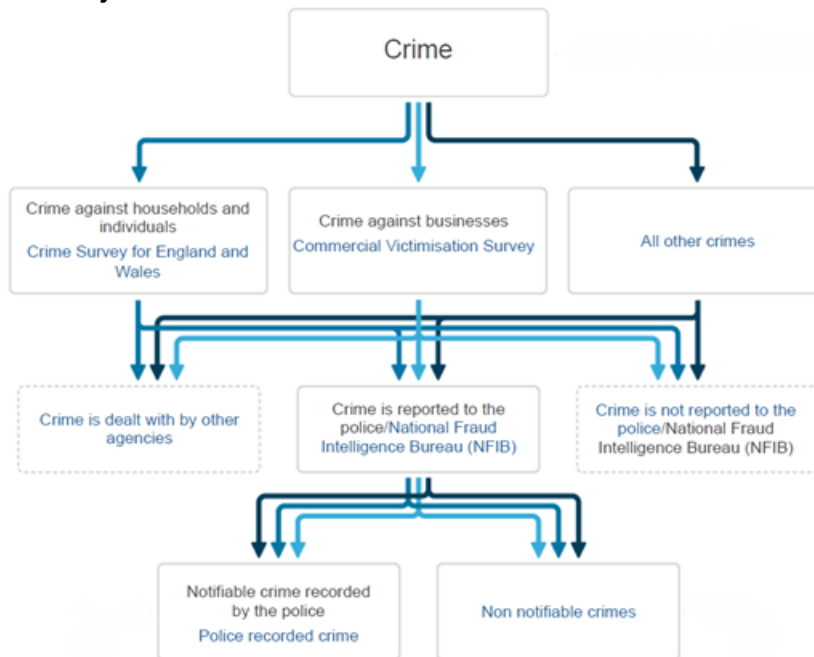

- “latest year” (or “latest survey year”) refers to the (survey) year ending December 2017
- “previous year” (or “previous survey year”) refers to the (survey) year ending December 2016
- any other time period is referred to explicitly

Crime statistics and the wider criminal justice system

The crime statistics reported in this release relate to only a part of the wider set of official statistics available on crime and other areas of the criminal justice system such as the outcomes of police investigations; the judicial process including charges, prosecutions and convictions; through to the management of prisons and prisoners.

Some of these statistics are published by the Home Office or the Ministry of Justice. We have produced [a flowchart](#) showing the connections between the different aspects of crime and justice, as well as the statistics available for each area. The following diagram is an extract from that flowchart and highlights the portion of the process that is covered by statistics included in this release.

Crime and justice statistics flowchart

Notes for: Things you need to know about this release

1. The full assessment report can be found on the [UK Statistics Authority](#) website. Data from the Crime Survey for England and Wales (CSEW) continue to be badged as National Statistics.
2. Police forces supply a more detailed statistical return for each homicide (murders, manslaughter and infanticides) recorded in their force area to the Home Office than the main police recorded crime series. These returns are used to populate the Home Office database called the Homicide Index.

5 . Overview of crime

Crime covers a wide range of offences, from the most harmful such as murder and rape through to relatively minor incidents of criminal damage or petty theft. Crime is often hidden and different types of offence occur in different circumstances and at different frequencies, meaning crime can never be measured entirely from any single source. The policy response to crime also tends to be specific to separate types of offence. Therefore, much of this bulletin focuses on individual types of crime.

CSEW estimated most types of crime have stayed at levels similar to the previous year

The latest estimates from the Crime Survey for England and Wales (CSEW) show that most types of crime have stayed at levels similar to the previous year. However, the overall level of crime measured by the CSEW fell, driven mainly by decreases in computer misuse offences.

Crime estimated by the survey has fallen in the last year, but there is no significant change when fraud and computer misuse are excluded

England and Wales, year ending December 1981 to year ending December 2017

Crime levels peaked in the mid 1990s following rises in most crime types particularly violent, sexual crime and burglary

Estimates excluding fraud and computer misuse are lower than the mid 1990s level

Crime estimated by the survey has fallen in the last year, but there is no significant change when fraud and computer misuse are excluded

England and Wales, year ending December 1981 to year ending December 2017

Source: Crime Survey for England and Wales, Office for National Statistics

Notes:

1. Data on this chart refer to different time periods: 1981 to 1999 refer to crimes experienced in the calendar year (January to December); and from year ending March 2002 onwards the estimates relate to crimes experienced in the 12 months before interview, based on interviews carried out in that financial year (April to March).
2. Data relate to adults aged 16 and over or to households.
3. New victimisation questions on fraud and computer misuse were incorporated into the CSEW from October 2015. The questions were asked of half the survey sample from October 2015 until September 2017, to test for detrimental effects on the survey as a whole and help ensure that the historical time series is protected, and have been asked of a full sample from October 2017.
4. In March 2018 the new CSEW estimates on fraud and computer misuse were assessed by the Office for Statistics Regulation against the Code of Practice for Statistics and were awarded National Statistics status.

The CSEW is the most reliable indicator of the long-term trends in the more common types of crime experienced by the general population because it has used a consistent method over time and is unaffected by changes in reporting rates or police activity. It also measures more crime than is recorded by the police because it includes crimes that do not come to their attention.

Most people are not victims of crime

The latest CSEW estimate of 10.6 million crimes against the household population may seem like a big number, but most people do not experience crime. The survey showed that the large majority of adults (8 in 10) were not a victim of any of the crimes asked about in the survey in the previous 12 months.

Likelihood of being a victim has fallen considerably

Around 4 in 10 adults were estimated to have been a victim of crime in 1995; before the survey included fraud and computer misuse in its coverage. In the year ending December 2017, just over 1 in 10 adults were a victim of crimes comparable with those measured in the 1995 survey. Including fraud and computer misuse, 2 in 10 adults were a victim of crime in the year ending December 2017.

Overall fall in CSEW crime driven by decrease in computer misuse offences while vehicle-related thefts increased

The latest estimates from the CSEW show that most types of crimes have stayed at similar levels to the previous year. When looking at the main types of crime, changes were only seen in:

- computer misuse offences (28% decrease to 1.37 million offences), which drove the fall in overall CSEW crime
- vehicle-related thefts (17% increase to 929,000 offences), which is supported by a 16% increase in vehicle offences recorded by the police to 452,683 offences; a category that is well reported to the police and thought to be well recorded

All other main types of crime measured by the survey showed no change, although changes were seen in some of the sub-categories (see [Appendix Table A1](#) for details). However, police recorded crime data showed evidence of rises in some other categories of crime, continuing the picture reported in the year ending September 2017 bulletin.

Recorded crime data only cover cases that are brought to the attention of the police and can be affected by varying policing priorities, activity and changes in crime-recording practices, and levels of public reporting. However, some types of crime are less affected by these issues and in these cases, the police figures can be a useful supplement to the CSEW and provide insight in areas which the survey does not cover well. The police figures indicate rises in the following types of crime:

- higher-harm violent offences involving the use of weapons
- offences of burglary and robbery

Genuine increases in some higher-harm violent offences

Violent crime covers a wide range of offences. The CSEW tends to provide the better measure of more common but less harmful crimes such as minor assault. The latest estimates from the survey show that violence was at a similar level to the previous year.

Police recorded crime is able to provide a measure that better covers the more harmful, less frequently-occurring offences that are not well measured by the survey. There is evidence of rises in some of these offences, which was most evident in the relatively low volume offences such as:

- offences involving knives or sharp instrument (up 22% to 39,598 recorded offences)
- offences involving firearms (up 11% to 6,604 recorded offences)

These offences tend to be disproportionately concentrated in London and other metropolitan areas; however, the majority of police force areas saw rises in these types of violent crime.

Knife or sharp instrument and firearm offences recorded by the police have shown an increase in the last two years

Notes:

1. Police recorded crime data are not designated as National Statistics.
2. Police recorded knife or sharp instrument offences data are submitted via an additional special collection. This special collection includes the offences: homicide; attempted murder; threats to kill; assault with injury and assault with intent to cause serious harm; robbery; rape; and sexual assault.
3. Firearms include: shotguns; handguns; rifles; imitation weapons such as BB guns or soft air weapons; other weapons such as CS gas, pepper spray and stun guns; and unidentified weapons. They exclude conventional air weapons, such as air rifles.

Although improved recording and more proactive policing may have contributed to these rises, there have also been genuine increases in these types of crime. This is supported by admissions data for NHS hospitals¹ in England, which have shown an increase in admissions for assault by a sharp object and increases in all three categories of assault by firearm discharge.

Homicides (excluding Hillsborough and terror-related incidents) have increased

The total number of homicides recorded by the police fell by 1% (to 688). However, recent trends have been affected by the recording of exceptional incidents with multiple victims such as the terrorist attacks in London² and Manchester, and events at Hillsborough in 1989³. While deaths resulting from these events are included in the latest homicide figures, we have also analysed trends excluding these victims to provide a more consistent comparison.

If these cases are excluded, the latest figures show that there were 54 more homicides than the previous year, a 9% rise to 653. This continues an upward trend seen in homicides since March 2014, indicating a change to the long-term downward trend seen in the previous decade.

Excluding terror attacks in London and Manchester and crimes recorded as a result of events at Hillsborough, homicides have increased over the last three years

England and Wales, year ending March 2003 to year ending December 2017

Excluding terror attacks in London and Manchester and crimes recorded as a result of events at Hillsborough, homicides have increased over the last three years

England and Wales, year ending March 2003 to year ending December 2017

Source: Police recorded crime, Home Office

Notes:

1. Police recorded crime data are not designated as National Statistics.
2. Data on homicide offences given in these police recorded crime data will differ from data from the Home Office Homicide Index, which are published annually by ONS, last released as part of [Homicide in England and Wales: year ending March 2017](#). Police recorded crime data on homicide represent the recording decision of the police based on the available information at the time the offence comes to their attention. Homicide Index data take account of the charging decision and court outcome in cases that have gone to trial. It is not uncommon for offences initially recorded as murder by the police to be charged or convicted as manslaughter at court.

Although police recorded crime data are not designated as National Statistics, the National Statistics status of statistics about unlawful deaths based on the Homicide Index⁴ was [restored](#) in December 2016.

Vehicle-related theft and burglary are also thought to show genuine increases

In addition to the increase in vehicle-related theft shown by both the CSEW and police recorded crime, there is also evidence of increases in burglary recorded by the police, which increased by 9% (up to 438,971 offences). This is thought to reflect a genuine increase in this type of crime because it is generally well recorded by the police and well reported by victims. If the increases in burglary recorded by the police continue, we would expect these to show up in the survey in due course.

The police have also recorded a rise in robbery (up 33% to 74,130 offences). Recording improvements are likely to have contributed to this rise, but the impact is thought to be less pronounced than for other crime types. Therefore, the increase may also reflect a real change in these crimes. The CSEW does not provide a robust measure of short-term trends in robbery as it is a relatively low-volume crime.

Rises in vehicle offences, burglary and robbery recorded by the police are thought to reflect genuine increases

England and Wales, year ending March 2003 to year ending December 2017

Rises in vehicle offences, burglary and robbery recorded by the police are thought to reflect genuine increases

Wales, Office for National Statistics

Notes:

1. More detail on further years can be found in Appendix tables A1 and A2.

2. Section 5 of the User Guide provides more information about the crime types included in this table.

3. Rates for violence, robbery, theft from the person and other theft of personal property are quoted per 1,000 adults; rates for domestic burglary, other household theft, and criminal damage are quoted per 1,000 households; rates for vehicle-related theft and bicycle theft are quoted per 1,000 vehicle-owning and bicycle-owning households respectively.

4. Data may not sum to totals shown due to rounding.

5. Statistically significant change at the 5% level is indicated by an asterisk.

6. : denotes not available. It is not possible to construct a rate for all theft offences or CSEW crime because rates for household offences are based on rates per household, and those for personal offences on rates per adult, and the two cannot be combined.

7. New victimisation questions on fraud and computer misuse were incorporated into the CSEW from October 2015. Up to the year ending September 2017 the questions were asked of half the survey sample. From October 2017 onwards the questions are being asked of a full survey sample.

8. This combined estimate is not comparable with headline estimates from earlier years. For year-on-year comparisons and analysis of long-term trends it is necessary to exclude fraud and computer misuse offences, as data on these are only available for the latest year.

.. Denotes not available as data not collected.

Table 2b: Crime Survey for England and Wales prevalence rates and numbers of victims for year ending December 2017 and percentage change¹

Unweighted base - number of adults	20,974	20,974		
All CSEW CRIME INCLUDING FRAUD AND COMPUTER MISUSE ⁹	20.0	9,309	..	-5 *

Source: Crime Survey for England and Wales, Office for National Statistics

Notes:

1. More detail on further years can be found in Appendix tables A3 and A8.
2. Section 5 of the User Guide provides more information about the crime types included in this table.

3. Percentages for violence, robbery, theft from the person and other theft of personal property are quoted for adults; percentages for domestic burglary, other household theft, and criminal damage are quoted for households; percentages for vehicle-related theft and bicycle theft are quoted for vehicle-owning and bicycle-owning households respectively.
 4. Where applicable, numbers in sub-categories will not sum to totals, because adults/households may have been a victim of more than one crime.
 5. Statistically significant change at the 5% level is indicated by an asterisk.
 6. This is the estimated percentage/number of adults who have been a victim of at least one personal theft crime or have been resident in a household that was a victim of at least one household theft crime.
 7. This is the estimated percentage/number of adults who have been a victim of at least one personal crime or have been resident in a household that was a victim of at least one household crime.
 8. New victimisation questions on fraud and computer misuse were incorporated into the CSEW from October 2015. Up to the year ending September 2017 the questions were asked of half the survey sample. From October 2017 onwards the questions are being asked of a full survey sample.
 9. This combined estimate is not comparable with headline estimates from earlier years. For year-on-year comparisons and analysis of long-term trends it is necessary to exclude fraud and computer misuse offences, as data on these are only available for the latest year.
- .. Denotes not available.

Caution should be taken when interpreting police recorded crime trends

A renewed focus on the quality of crime recording by the police in recent years is thought to have led to improved compliance with the National Crime Recording Standard (NCRS), leading to a greater proportion of reported crimes being recorded by the police⁵. Despite improvements made in recording in recent years, the [latest inspection reports](#)⁶ from Her Majesty's Inspectorate of Constabulary and Fire & Rescue Services (HMICFRS) suggest that some offences, such as violent crime, are still significantly under-recorded by the police⁷. For more information see the Quality and methodology section in [Crime in England and Wales: year ending March 2017](#).

Given the different factors affecting the reporting and recording of offences by the police, these data do not currently provide a reliable indication of current trends in crime and must be interpreted with caution. Although police recorded crime data cannot provide a reliable estimate of trends in the prevalence of crime, they do provide information about demands on the police in relation to these offences.

For more information about crimes recorded by the police, see What's happened to the volume of crime recorded by the police?

Table 3: Police recorded crimes in England and Wales – rate, number and percentage change for year ending December 2017

Offence group	January 2017 to December 2017 compared with:			
	Jan '17 to Dec '17		Apr '06 to Mar '07	Jan '16 to Dec '16
	Rate per 1,000 population	Number of offences	Number of offences - percentage change	
VICTIM-BASED CRIME	72	4,174,919	-13	14

Source: Police recorded crime, Home Office

1. Police recorded crime data are not designated as National Statistics.
2. Police recorded crime statistics based on data from all 44 forces in England and Wales (including the British Transport Police).
3. Appendix tables A4 and A7 provide detailed footnotes and further years.
4. Includes causing death or serious injury by dangerous driving, causing death by careless driving when under the influence of drink or drugs, causing death by careless or inconsiderate driving, causing death by driving: unlicensed or disqualified or uninsured drivers, causing death by aggravated vehicle taking.
5. Includes attempted murder, intentional destruction of viable unborn child, more serious wounding or other act endangering life (including grievous bodily harm with and without intent) and less serious wounding offences.
6. Includes threat or conspiracy to murder, other offences against children and assault without injury (formerly common assault where there is no injury).
7. Includes harassment, racially or religiously motivated harassment, stalking, malicious communications.
8. All other theft offences now includes all 'making off without payment' offences recorded since year ending March 2003. Making off without payment was previously included within the fraud offence group, but following a change in the classification for year ending March 2014, this change has been applied to previous years of data to give a consistent time series.
9. Total fraud offences cover crimes recorded by the National Fraud Intelligence Bureau via Action Fraud, Cifas and Financial Fraud Action UK. Action Fraud have taken over the recording of fraud offences on behalf of individual police forces. Percentage changes compared with year ending March 2007 are not presented, as fraud figures covered only those crimes recorded by individual police forces. Given the addition of new data sources, it is not possible to make direct comparisons with years prior to Year ending March 2012.

Notes for: Overview of crime

1. Data are from [NHS Hospital Admitted Patient Care Activity, 2015 to 2016](#) and [NHS Hospital Admitted Patient Care Activity, 2016 to 2017](#). See the "External Causes" dataset.
2. Includes victims of the London Bridge and Borough Market, and Westminster attacks. Events at Finsbury Park are not included as there were not multiple victims of homicide.
3. 96 offences of manslaughter from Hillsborough were recorded in April 2016 when the inquest into these events concluded.
4. Police forces supply a more detailed statistical return for each homicide (murders, manslaughters and infanticides) recorded in their force area to the Home Office than the main police recorded crime series. These returns are used to populate the Home Office database called the Homicide Index.
5. The [Crime-recording: making the victim count](#) report, published by HMICFRS in late 2014, found that violent offences had been substantially under-recorded (by 33% nationally) and led to police forces reviewing and improving their recording processes.
6. These reports were published during 2016 and 2018, and the most recent reports were published on 15 February 2018. Three re-inspection reports were published on 10 April 2018.
7. Of the 20 published inspection reports, only five forces received a rating of "good", with a further five rated as "requires improvement" and 10 as "inadequate". Three forces rated as "inadequate" have since been re-inspected and their ratings improved, with two of these forces rated as "good" and one as "requires improvement".

6 . No change in most commonly occurring types of violent crime

Violent crime covers a wide range of offences including minor assaults (such as pushing and shoving), harassment and psychological abuse (that result in no physical harm), through to wounding, physical assault and death. Neither of our two main sources provide a full picture of violent crime. The Crime Survey for England and Wales (CSEW) data include incidents with and without injury. Violent offences in police recorded data are referred to as "violence against the person" and include homicide, death or serious injury caused by unlawful driving, violence with injury, violence without injury, and stalking and harassment¹. Attempted offences are included in both "violence with injury" and "violence without injury" figures.

CSEW is the best measure of trends in most common types of violence

The CSEW provides the better measure of trends for the population and violent offences that it covers. It has used a consistent methodology since the survey began in 1981 and covers crimes that are not reported to or recorded by the police. In the year ending March 2017, the CSEW showed that more than half of violent crime victims (57%) did not report their experiences to the police, a return to levels seen preceding the year ending March 2013, following higher levels of reporting in the previous three years. In addition, police recorded crime statistics may be affected by changes in recording practices and police activity.

One very important difference between the two measures of crime relates to how each are able to measure some forms of crime better than others; the CSEW tends to provide the better measure of more common but less harmful crimes while police recorded crime is able to provide a measure that better covers the more harmful, less frequently-occurring offences that come to their attention such as homicide, knife crime and gun crime.

CSEW has shown no change in level of violence in recent years

There were an estimated 1.2 million incidents of violence experienced by adults aged 16 and over in the latest CSEW survey year ending December 2017; no significant change from the previous year. Both “violence with injury” and “violence without injury” showed no significant change.

Crime Survey for England and Wales shows long-term reductions in violent crime but little change in recent years

England and Wales, year ending December 1981 to year ending December 2017

The cumulative effect of the downward trend in violent crime since 1981 resulted in a 25% statistically significant fall compared with year ending March 2013.

Source: Crime Survey for England and Wales, Office for National Statistics

Notes:

1. Prior to the year ending March 2002, CSEW respondents were asked about their experience of crime in the previous calendar year, so year-labels identify the year in which the crime took place. Following the change to continuous interviewing, respondents' experience of crime relates to the full 12 months prior to interview (that is, a moving reference period). Year-labels for the year ending March 2002 identify the CSEW year of interview.

Around 2 in every 100 adults were a victim of CSEW violent crime in the latest survey year, compared with around 3 in 100 adults in the survey year ending March 2007 and 5 in 100 adults in 1995 (the peak year).

Long-term reductions in violent crime supported by other data

The longer-term reductions in violent crime, as shown by the CSEW, are also reflected in the findings of the most recent [admissions data for NHS hospitals](#) in England. Assault admissions for the year ending March 2017² (26,450) are 42% lower than the year ending March 2007 (45,890 admissions). In addition, research conducted by the [Violence and Society Research Group at Cardiff University \(PDF, 502KB\)](#) shows similar findings. Results from their annual survey, covering a sample of hospital emergency departments and walk-in centres in England and Wales, show that serious violence-related attendances in 2017 have fallen 39% since 2010. However, similar to the latest CSEW findings, the latest data show little change in 2017 compared with 2016 (1% increase).

Estimates of violence against 10-to-15-year-olds, as measured by the CSEW, can be found in [Appendix tables A9, A10, A11 and A12](#). The estimates are not directly comparable with the main survey of adults, so are not included in the headline totals.

Police recorded crime can be a good measure of less common types of violence

While the CSEW gives us a good picture of the overall trend in violent crime, it is not good at measuring some types of violence. In these cases, police recorded crime is a useful source as the better measure of the higher-harm but less common types of violence. The police recorded continuing rises in a number of such offences that are either not covered or not well-measured by the survey due to their low volume – homicide, firearm offences and knife or sharp instrument offences. See [Offences involving weapons recorded by the police continue to rise](#) for further information on offences involving weapons.

Homicide (excluding Hillsborough and terror-related incidents) has increased

Unlike many other violence against the person offences, the quality of recording of homicides by the police is thought to have remained consistently good.

The police recorded 688 homicides^{3,4}, in the latest year to December 2017, a 1% fall compared with the previous year ([Table A4](#)). However, recent trends in homicide have been affected by the recording of incidents with multiple victims. Of the 688 homicides recorded in the year ending December 2017, 35 related to the London and Manchester terror attacks. The 96 cases of manslaughter that occurred at Hillsborough in 1989 were recorded in the previous year.

Excluding the Hillsborough cases from the year ending December 2016 and the London and Manchester terror attacks from the year ending December 2017, there was a volume rise of 54 homicides (a 9% rise, up to a total of 653). This follows the general upward trend seen in the last three years and contrasts with the previously downward trend since the introduction of the National Crime Recording Standard (NCRS) in 2002.

Homicides have increased over the last three years, excluding crimes recorded as a result of Hillsborough and London and Manchester terror attacks

England and Wales, year ending March 2003 to year ending December 2017

Homicides have increased over the last three years, excluding crimes recorded as a result of Hillsborough and London and Manchester terror attacks

England and Wales, year ending March 2003 to year ending December 2017

Source: Police recorded crime, Home Office

Notes:

1. Police recorded crime data are not designated as National Statistics.
2. Data on homicide offences given in these police recorded crime data will differ from data from the Home Office Homicide Index, which are published annually by ONS, last released as part of [Homicide in England and Wales: year ending March 2017](#). Police recorded crime data on homicide represent the recording decision of the police based on the available information at the time the offence comes to their attention. Homicide Index data take account of the charging decision and court outcome in cases that have gone to trial. It is not uncommon for offences initially recorded as murder by the police to be charged or convicted as manslaughter at court.
3. The homicide figure for year ending March 2003 includes 172 homicides attributed to Harold Shipman.
4. The homicide figure in year ending March 2006 includes 52 victims of the 7 July London bombings.
5. The homicide figure for year ending March 2017 includes 96 victims of Hillsborough.
6. The year ending December 2017 includes 35 victims of the Manchester Arena bombing, and London terror attacks.

The number of homicides where a knife or sharp instrument had been used has increased by 26% in the last year (from 209 to 264 offences). For more information on crimes involving a knife or sharp instrument, see Table 4.

Homicide rate has fallen in last decade

Historically, the number of homicides increased from around 300 per year in the early 1960s to over 800 per year in the early years of this century, which was at a faster rate than population growth over the same period. However, over the past decade, the volume of homicides has generally decreased while the population of England and Wales has continued to grow. The rate of homicide fell 17% between the year ending March 2007 and the year ending December 2017, from 14 homicides per 1 million of the population to 12 homicides per 1 million, although small increases have been seen in the last two years.

Small decrease in death or serious injury caused by unlawful driving

A sub-category covering offences related to death or serious injury caused by unlawful driving has been included within the violence against the person offence group since the year ending June 2017. It contains offences previously counted under “violence with injury”. This sub-category saw a 2% decrease compared with the previous year (718 down from 732 offences). This is in contrast with recent years where there has been a rising trend. As with homicide offences, this category is thought to be well-recorded by the police.

Other types of violence recorded by the police are not thought to provide a reliable measure of trends in violent crime. Factors influencing changes in police recorded violence are described in more detail in [What's happened to the volume of crime handled by the police?](#)

There is more detailed information on long-term trends and the circumstances of violence in [The nature of violent crime in England and Wales: year ending March 2017](#) and [Homicide in England and Wales: year ending March 2017](#). However, these articles do not include the most recent statistics for the year ending December 2017.

Notes for: No change in most commonly occurring types of violent crime

1. There are some closely-related offences in the police recorded crime series, such as public order offences, that have no identifiable victim and are contained within the “other crimes against society” category.
2. [Hospital Admitted Patient Care Activity, 2016-17](#) and [Hospital Episode Statistics, Admitted Patient Care – England, 2006-07](#) provided by NHS Digital. Assault admissions do not include sexual offences but include assault codes X85-Y04 and Y08 and Y09 from the dataset.
3. Homicide includes the offences of murder, manslaughter, corporate manslaughter and infanticide. Figures from the Homicide Index for the time period April 2016 to March 2017, which take account of further police investigations and court outcomes, were published in [Homicide in England and Wales: year ending March 2017](#) on 8 February 2018.
4. These figures include murders related to the Westminster Bridge terrorist-related incident in March 2017. It also includes seven offences of corporate manslaughter relating to the Croydon tram crash.

7 . Offences involving weapons recorded by the police continue to rise

Some of the more serious offences in the police recorded crime data can be broken down by whether or not a knife or sharp instrument was involved¹. The overall number of offences involving a knife or sharp instrument has seen an increase in the last year, with increases in all offences included within the data collection.

Data are also available for police recorded crimes involving the use of firearms (that is, if a firearm is fired, used as a blunt instrument, or used as a threat). Offences involving the use of a firearm have also seen an increase in the last year.

While these offences are relatively well recorded by the police, they can only provide a partial picture as not all offences will come to their attention.

As offences involving the use of weapons are relatively low in volume, the Crime Survey for England and Wales (CSEW) is not able to provide reliable trends for such incidents.

Highest number of offences involving knives or sharp instruments since 2011²

Police recorded knife or sharp instrument offences data are submitted via an additional special collection. Proportions of offences involving the use of a knife or sharp instrument presented in this section are calculated based on figures submitted in this special collection. Other offences exist that are not shown in this section that may include the use of a knife or sharp instrument.

The police recorded 39,598 offences involving a knife or sharp instrument in the latest year ending December 2017, a 22% increase compared with the previous year (32,468) and the highest number in the seven-year series (from year ending March 2011), the earliest point for which comparable data are available³. The past three years have seen a rise in the number of recorded offences involving a knife or sharp instrument, following a general downward trend in this series since the year ending March 2011.

Increases evident in police recorded offences involving a knife or sharp instrument for the third year

England and Wales, year ending March 2011 to year ending December 2017

Increases evident in police recorded offences involving a knife or sharp instrument for the third year

55% increase
year ending

England and Wales, year ending March 2011 to year ending December 2017

Source: Police recorded crime, Home Office

Notes:

1. Police recorded crime data are not designated as National Statistics.

The offences “assault with injury” and “assault with intent to cause serious harm” accounted for around half (49%) of total selected offences involving a knife or sharp instrument (Table 4). All offence categories for which data are collected showed increases.

Table 4: Selected violent and sexual offences involving a knife or sharp instrument recorded by the police

England and Wales, year ending December 2016 and year ending December 2017 with percentage change

England and Wales

	Jan '16 to Dec '16	Jan '17 to Dec '17	Jan '17 to Dec '17 compared with previous year
Selected offences involving a knife or sharp instrument	Number of offences		Percentage change
Attempted murder	322	385	20
Threats to kill	2,591	2,868	11
Assault with injury and assault with intent to cause serious harm	16,778	19,213	15
Robbery	12,039	16,229	35
Rape	375	448	19
Sexual assault ⁶	154	191	24
Total selected offences	32,259	39,334	22
Homicide ⁷	209	264	26
Total selected offences including homicide	32,468	39,598	22
Rate per million population - selected offences involving a knife or sharp instrument			
Total selected offences including homicide	561	675	

Source: Police recorded crime, Home Office

1. Police recorded crime data are not designated as National Statistics.
2. Police recorded crime statistics based on data from all 44 forces in England and Wales (including the British Transport Police).
3. Police recorded knife and sharp instrument offences data are submitted via an additional special collection. Proportions of offences involving the use of a knife or sharp instrument presented in this table are calculated based on figures submitted in this special collection. Other offences exist that are not shown in this table that may include the use of a knife or sharp instrument.
4. Data from Surrey Police include unbroken bottle and glass offences, which are outside the scope of this special collection; however, it is not thought that offences of this kind constitute a large enough number to impact on the national figure.
5. Numbers differ from those previously published due to Sussex Police revising their figures to exclude unbroken bottles.
6. Sexual assault includes indecent assault on a male/female and sexual assault on a male/female (all ages).
7. Homicide offences are those currently recorded by the police as at 21st February 2018 and are subject to revision as cases are dealt with by the police and by the courts, or as further information becomes available. They include the offences of murder, manslaughter, infanticide and, as of year ending March 2013, corporate manslaughter. These figures are taken from the detailed record level Homicide Index (rather than the main police collection for which forces are only required to provide an overall count of homicides, used in Appendix table A4). There may therefore be differences in the total homicides figure used to calculate these proportions and the homicide figure presented in Appendix table A4.

The majority of police forces (37 of the 44)⁴ recorded a rise in offences involving knives or sharp instruments. The Metropolitan Police had the largest volume increase (accounting for 48% of the total increase). A breakdown of offences for each police force and the time series for these data are published in the Home Office's [knife crime open data table](#)⁵.

Recent increases reflect a real rise in offences involving knives or sharp instruments

While it is thought that improvements in recording practices have contributed to the recent increases in recorded knife or sharp instrument offences, these increases also reflect a real rise in the occurrence of these types of crime, representing a change to the downward trend seen in recent years.

This is supported by evidence from admissions data for NHS hospitals in England⁶, which showed a 7% increase in admissions for assault by a sharp object, from 4,054 in the year ending March 2016 to 4,351 in the year ending March 2017.

Possession of an article with a blade or point also rose

Police recorded "possession of an article with a blade or point" offences also rose, by 33%, to 17,437 offences in the latest year. This rise is consistent with increases seen over the last four years, but this is the highest figure since the series began in the year ending March 2009. This figure can often be influenced by increases in targeted police action in relation to knife crime, which is most likely to occur at times when rises in offences involving knives are seen.

Offences involving firearms have increased following long-term declines

Offences involving firearms⁷ increased by 11% (to 6,604) in the year ending December 2017 compared with the previous year (5,945 offences).

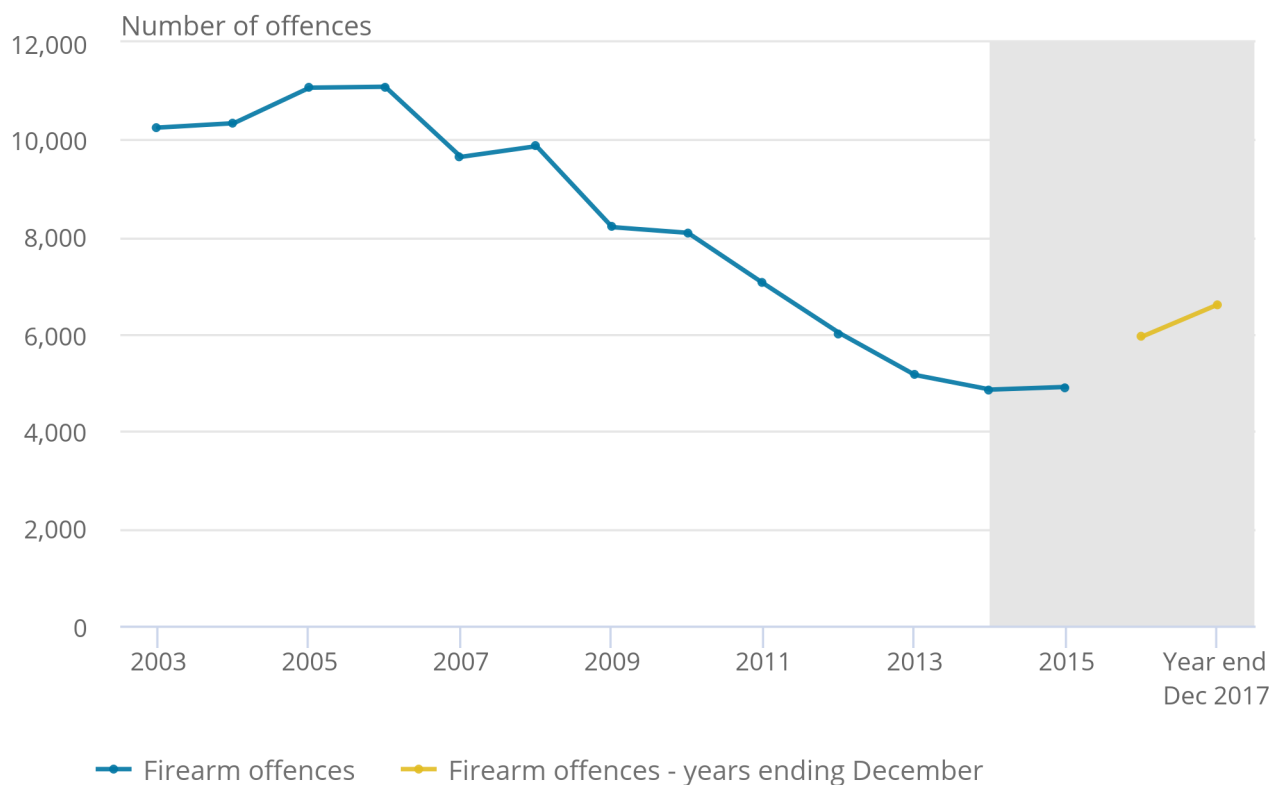

Police recorded firearms offences have increased over the last three years

England and Wales, year ending March 2003 to year ending December 2017

Police recorded firearms offences have increased over the last three years

36% increase since year ending March 2014

England and Wales, year ending March 2003 to year ending December 2017

Source: Police recorded crime, Home Office

Notes:

1. Police recorded crime data are not designated as National Statistics.
2. Firearms include: shotguns; handguns; rifles; imitation weapons such as BB guns or soft air weapons; other weapons such as CS gas, pepper spray and stun guns; and unidentified weapons. They exclude conventional air weapons, such as air rifles.

This was driven by:

- a 12% increase in offences involving handguns (up to 2,808 from 2,507, accounting for 46% of the overall increase)
- a 21% increase in offences involving unidentified firearms (up to 908 from 753)
- a 20% increase in offences involving shotguns (up to 655 from 548)

The latest rise continues an upward trend seen in firearms offences in the last few years, however, offences are still 32% below a decade ago (in the year ending March 2007).

Some of the increase in offences involving firearms is genuine

Some of the increase in the number of offences involving firearms is a genuine rise. Evidence of a genuine rise can be seen in admissions data for NHS hospitals in England, which showed increases in all three categories of assault by firearm discharge⁹, from 109 admissions in the year ending March 2016 to 135 admissions in the year ending March 2017.

But it is likely that improvements in crime recording have also been a factor. For example:

- around one-third (32%)¹⁰ of the rise is due to an increase in possession of firearms offences with intent – these offences may have been recorded as simple possession offences previously, which are not covered by this data collection
- around one-tenth (9%)¹¹ of the increase is in offences involving some of the less serious weapons such as BB guns and CS gas¹² – it is likely that these are now included in police returns when previously they were excluded

While a full geographic breakdown is not yet available, information from police forces suggests that the majority of areas have seen increases in recorded offences involving firearms, with 63% of the increase in England and Wales occurring in the Metropolitan Police force area (36%) and the Greater Manchester Police force area (27%).

Recently published data by London's Air Ambulance Data are from [London's Air Ambulance Mission Maps 2017](#). These data also suggest an increase in serious offences involving a weapon. In 2017, injuries resulting from stabbings and shootings were the most common cause for a helicopter to be dispatched, overtaking trauma resulting from road traffic collisions.

Further analysis on offences involving knives or sharp instruments and firearms, including figures based on a broader definition of the types of firearm involved¹⁴, can be found in [Offences involving the use of weapons: data tables](#). However, this does not include the most recent statistics for the year ending December 2017.

Notes for: Offences involving weapons recorded by the police continue to rise

1. These are: homicide; attempted murder; threats to kill; assault with injury and assault with intent to cause serious harm; robbery; rape; and sexual assault.
2. A sharp instrument is any object that pierces the skin (or in the case of a threat, is capable of piercing the skin), for example, a broken bottle.
3. The [Focus on violent crime and sexual offences](#) publication includes data on offences involving a knife or sharp instrument going back to the year ending March 2009; however, this excludes data for West Midlands and Sussex due to inconsistencies in their recording practices, which did not change until the year ending March 2011. Data for the year ending March 2017 are published in the [Offences involving the use of weapons: data tables](#).
4. At time of publication, Greater Manchester Police were reviewing their knife crime figures, therefore data should be used with caution. Data will be updated following the review.
5. See Homicide in England and Wales: Appendix tables for more information on homicides committed using a knife or sharp instrument.
6. Data are from [NHS Hospital Admitted Patient Care Activity, 2015 to 2016](#) and [NHS Hospital Admitted Patient Care Activity, 2016 to 2017](#). See the “External Causes” dataset.
7. Firearms include: shotguns; handguns; rifles; imitation weapons such as BB guns or soft air weapons; other weapons such as CS gas or pepper spray and stun guns; and unidentified weapons. These figures exclude conventional air weapons, such as air rifles.
8. Data are from [NHS Hospital Admitted Patient Care Activity, 2015 to 2016](#) and [NHS Hospital Admitted Patient Care Activity, 2016 to 2017](#).
9. Firearm discharge admissions categories are: “assault by handgun discharge”, “assault by rifle, shotgun and larger firearm discharge” and “assault by other and unspecified firearm discharge.”
10. Data not shown.
11. Data not shown.
12. BB guns, soft air weapons, CS Gas and pepper spray.
13. Data are from [London's Air Ambulance Mission Maps 2017](#).
14. The broader definition of firearms includes conventional air weapons, such as air rifles.

8 . Computer misuse offences show year-on-year fall

New questions on computer misuse were introduced to half of the Crime Survey for England and Wales (CSEW) sample from October 2015, and increased to a full sample from October 2017.

We can look at changes in these estimates over the last two years. However, as this comparison is based on two data points only, caution must be taken in drawing conclusions about trends at this early stage.

Fall in CSEW computer viruses drives fall in computer misuse

Offences involving computer misuse showed a 28% decrease from the survey year ending December 2016 (down to 1.4 million offences from 1.9 million), largely owing to a 34% fall in “computer viruses” (down to 840,000 offences).

Table 5: Crime Survey for England and Wales computer misuse - number of incidents for year ending December 2016 and year ending December 2017 with percentage change^{1 2}

England and Wales		Adults aged 16 and over	
Offence group	Jan '16 to Dec '16	Jan '17 to Dec '17	Percentage change and significance ³
	Number of incidents (thousands)		
Computer misuse	1,917	1,374	-28 *
Computer virus	1,275	840	-34 *
Unauthorised access to personal information (including hacking)	642	534	-17
Unweighted base - number of adults	17,500	20,974	

Source: Crime Survey for England and Wales, Office for National Statistics

1. New victimisation questions on computer misuse were incorporated into the CSEW from October 2015. Up to the year ending September 2017 the questions were asked of half the survey sample. From October 2017 onwards the questions are being asked of a full survey sample.

2. In March 2018 the new CSEW estimates on computer misuse were assessed by the Office for Statistics Regulation against the Code of Practice for Statistics and were awarded National Statistics status.

3. Statistically significant change at the 5% level is indicated by an asterisk.

What do incidents of computer misuse reported to Action Fraud show?

“Computer misuse crime”¹ referred to the National Fraud Intelligence Bureau (NFIB) by Action Fraud increased by 36% (up to 22,154 offences), largely accounted for by a rise in “hacking – social media and email” over the last year (up 74% to 7,792 offences).

In interpreting these figures it is important to consider that incidents of computer misuse reported to Action Fraud represent only a small fraction of all computer misuse, as many incidents are not reported. As such, it is not possible to make meaningful comparisons with computer misuse measured by the CSEW. The latest rise in Action Fraud reports is likely to reflect an increasing awareness of social media scams among the public, leading to a greater likelihood of such offences being reported.

A large rise was also seen in computer viruses reported to Action Fraud over the last year (up 53% to 7,954 offences), which is thought to be due to a rise in levels of malware (mainly ransomware and Trojans), including several high-profile attacks and security breaches on national institutions (for example, the WannaCry virus linked to the NHS cyberattack in May 2017). Such offences would not have been captured by the CSEW as the primary victims were organisations rather than individuals.

Notes for Computer misuse offences show year-on-year fall:

1. Computer misuse crime covers any unauthorised access to computer material, as set out in the Computer Misuse Act 1990.

9 . No change in the volume of fraud offences in the last year

The Crime Survey for England and Wales (CSEW) provides the best indication of the volume of fraud offences directly experienced by individuals in England and Wales. CSEW estimates cover a wide range of fraud offences, including attempts and offences involving a loss, and include incidents not reported to the authorities. Latest findings from the survey estimated the number of fraud incidents to be similar to the previous survey year.

A similar picture of no change was also shown by the overall number of recorded crime incidents referred to the National Fraud Intelligence Bureau (NFIB) by Action Fraud – the public-facing national fraud and cybercrime reporting centre, as well as two industry bodies, Cifas and UK Finance ^{1,2}, who report instances of fraud where their member organisations have been a victim.

The number of incidents estimated by the CSEW is substantially higher than the number of incidents referred to the NFIB, as the survey captures a large volume of lower-harm cases that are less likely to have been reported to the authorities. In contrast, incidents of fraud referred to the NFIB by Action Fraud, Cifas and UK Finance will mostly tend to be focused on cases at the more serious end of the spectrum, as by definition they will only include crimes that the victim considers serious enough to report to the authorities or where there are viable lines of investigation.

As a result, fraud offences referred to the authorities make up a relatively small proportion of the overall volume of fraud. This is supported by findings from the CSEW, which suggests that less than one-fifth (17.3%) of incidents of fraud either come to the attention of the police or are reported by the victim to Action Fraud ([Table E7, year ending March 2017](#)).

Further information on each of the data sources and the differences between them can be found in Section 5.4 of the [User guide](#) and also in the [Overview of fraud and computer misuse statistics](#) article.

No change in fraud measured by CSEW

New questions on fraud were introduced to half of the CSEW sample from October 2015 and increased to a full sample from October 2017. We can look at changes in these estimates over the last two years. However, as this comparison is based on two data points only, caution must be taken in drawing conclusions about trends at this early stage.

Results for the survey year ending December 2017 show no change in fraud offences when compared with the previous year (3.2 million offences). The only category of fraud to show a significant change was “other fraud” (down 64%, from 97,000 to 35,000 offences), which covers offences such as investment fraud or charity fraud. Over half of fraud incidents for the latest survey year were cyber-related ³ (56% or 1.3 million incidents) ([Table E2](#)).

Table 6: Crime Survey for England and Wales fraud - number of incidents for year ending December 2016 and year ending December 2017 with percentage change^{1,2}

England and Wales		Adults aged 16 and over	
Offence group	Jan '16 to Dec '16	Jan '17 to Dec '17	Percentage change and significance ³
Number of incidents (thousands)			
Fraud	3,480	3,241	-7
Bank and credit account fraud	2,454	2,332	-5
Consumer and retail fraud ⁴	827	813	-2
Advance fee fraud	102	61	-41
Other fraud	97	35	-64 *
Unweighted base - number of adults	17,500	20,974	

Source: Crime Survey for England and Wales, Office for National Statistics

1. New victimisation questions on fraud were incorporated into the CSEW from October 2015. Up to the year ending September 2017 the questions were asked of half the survey sample. From October 2017 onwards the questions are being asked of a full survey sample.

2. In March 2018 the new CSEW estimates on fraud were assessed by the Office for Statistics Regulation against the Code of Practice for Statistics and were awarded National Statistics status.

3. Statistically significant change at the 5% level is indicated by an asterisk.

4. Non-investment fraud has been renamed as 'Consumer and retail fraud' to reflect the corresponding name change to the Home Office Counting Rules from April 2017.

Further findings from the CSEW fraud and computer misuse questions for the year ending December 2017 are presented in [Tables E1 and E2](#).

Recorded crime also shows no change in fraud offences

The recorded crime series incorporates fraud offences collated by the NFIB from Action Fraud, Cifas and UK Finance⁴ and referred to the police for investigation. There was a similar volume of fraud offences recorded in England and Wales in the year ending December 2017 (639,457 offences) compared with the previous year (639,476 offences).

Fraud offences recorded by the NFIB have shown no change in the last year following increases over the previous four years

England and Wales, year ending March 2012 to year ending December 2017

Fraud offences recorded by the NFIB have shown no change in the last year following increases over the previous four years

England and Wales, year ending March 2012 to year ending December 2017

Source: Action Fraud, National Fraud Intelligence Bureau (NFIB)

Although there was no overall change, differences were shown in the number of offences recorded in the last year, as reported separately by Action Fraud, Cifas and UK Finance. Overall offences showed:

- Action Fraud rose by 10% (up to 273,598 offences)
- Cifas fell by 7% (down to 283,284 offences)
- UK Finance fell by 6% (down to 82,575 offences)

The falls reported by both Cifas and UK Finance were due largely to a volume decrease in “banking and credit industry fraud”, with UK Finance showing a fall of 6% (to 82,575 offences), and Cifas showing a fall of 5% (to 244,968 offences). This latest decrease reported by Cifas follows a period of increases seen in this type of fraud, and is driven largely by a decrease in “cheque, plastic card and online bank accounts fraud” (down 5% to 169,504 offences).

Cifas also reported a 3% decrease in the latest year in the number of incidents of “application fraud” referred to NFIB. This includes opening up an account using fake or stolen documents in someone else’s name. Again, this latest decrease in application fraud reported by Cifas follows previous large rises and is thought to reflect a return to normal levels after a spike in reporting in September 2016, as well as banks taking more preventative measures, in turn resulting in fewer fraudulent applications getting through the screening process.

The increase in offences reported to Action Fraud was driven largely by volume increases in “advance fee payment fraud” (up 32% to 52,469 offences)⁵ and “consumer and retail fraud” (up 4% to 105,921 offences). These are in contrast with the CSEW findings indicating no change in these fraud types and may be explained, in part, by differences in the coverage of the two sources.

Some caution must also be taken in interpreting this latest rise. Action Fraud recorded lower than normal monthly volumes of fraud offences between July 2015 and April 2016, following the company contracted to provide the call centre service going into administration⁶. Volumes have recovered but because the lower-volume months form part of the comparator year (year ending December 2016), the latest figure will have been influenced by this issue, albeit to a lesser extent than seen previously.

A full breakdown of the types of fraud offences referred to the NFIB by Action Fraud, Cifas and UK Finance in the latest year is presented in Table A5 and a definition of terms is provided in the [User guide](#).

A police force area breakdown of Action Fraud data based on where the individual victim lives, or in the cases of businesses, where the business is located, is available from the year ending March 2016 ([Table E3](#)). The latest data show there was generally less variation in rates of fraud by police force area than for most other types of crime, although rates for force areas in southern England were generally a little higher than those among force areas in Wales or northern England.

Additional administrative data indicate a rise in card and bank account fraud

Additional data collected by UK Finance via their CAMIS system provide a broader range of bank account and plastic card frauds than those referred to the NFIB. These data are able to capture card fraud not reported to the police for investigation⁸. As a result, they provide a better picture of the scale of bank account and plastic card fraud in the UK, which helps to bridge the gap between the broad coverage provided by the CSEW and the narrower focus of offences referred to the NFIB. Most of the additional offences covered in the CAMIS data fall into the category of “remote purchase fraud”⁹ and fraudulent incidents involving lost or stolen cards, which account for a high proportion of plastic card fraud that is excluded from the NFIB figures.

In the latest year, UK Finance reported 1.9 million cases of frauds (excluding Authorised Push Payments) on UK-issued cards, cheque fraud and remote banking fraud via CAMIS¹⁰, an increase of 3% from the previous year ([Table F4](#)). The introduction of chip card technology has forced fraudsters to change their methods of working and most of this increase is covered by offences falling into the category “lost or stolen cards”. This increase in incidents involving lost and stolen cards is related to an increase in distraction thefts, where fraudsters are stealing cards in shops and at cash machines, and courier scams, where victims are tricked into handing over their cards on the doorstep¹¹.

In support of this, data on the nature of theft from the person offences from the CSEW for the survey year ending March 2017 indicate that credit cards were one of the most commonly stolen items during incidents of theft from the person (44%) and were stolen in a higher proportion of incidents than five years ago (23%).

Authorised Push Payment fraud is included in CAMIS data for the first time

Authorised Push Payment (APP) fraud relates to cases where victims are tricked into sending money directly from their account to an account that the fraudster controls. APP is included for the first time in the UK Finance CAMIS data for the year ending December 2017. As this is a new data collection, it is not yet possible to make comparisons over time. The new data show that in the year ending December 2017, 43,875 cases of APP fraud were reported to UK Finance, pushing the total CAMIS volume to 2 million incidents of fraud

APP fraud can often involve significant sums of money and have adverse financial and emotional consequences for the victim. Unlike most other frauds, victims of APP fraud authorise the payment themselves and current legislation means that they have no legal protection to cover them for losses. UK Finance reported that £236 million was lost through such scams in 2017¹². The majority of victims (88%) were retail consumers, losing an average of £2,784, and the remainder were businesses who lost on average £24,355 per case. These new data were produced in response to investigations by the Payment Systems Regulator (PSR) into a Super-complaint received from the consumer group Which? in 2016. Following the [Super-complaint](#), the PSR, the [Financial Conduct Authority \(FCA\)](#) and the [payments industry](#) (represented by UK Finance) have developed an ongoing programme of work to reduce the harm to consumers from APP scams¹³.

For more information on the differences between the main sources of fraud and their strengths and limitations, please see the [Overview of fraud and computer misuse statistics](#) article.

Notes for: No change in the volume of fraud offences in the last year

1. Formerly known as Financial Fraud Action UK (FFA UK). As of 1 July 2017, FFA UK is now integrated into UK Finance, a new trade association representing the finance and banking industry in the UK.
2. For more information on these reporting bodies, please see Section 5.4 of the [User guide](#) and also the [Overview of fraud and computer misuse statistics](#) article.
3. Based on whether the internet or any type of online activity was related to any aspect of the offence.
4. For further information on these sources and their strengths and weaknesses, please see Section 5.4 of the [User guide](#) and also the [Overview of fraud and computer misuse statistics](#) article.
5. This is largely accounted for by an increase in “other advance fee frauds”, relating in particular to a scam in the summer months of 2017, where fraudsters contacted victims claiming to be from HM Revenue and Customs (HMRC) and tricked them into paying bogus debts and taxes. One of the payment methods requested by the fraudsters was iTunes gift cards.
6. For further information, please see Section 5.4 of the [User guide](#).
7. For more information, please see Section 5.4 of the [User guide](#).
8. The CAMIS system contains cases where it has been judged that there is no evidential value and no hope of identifying the offender. CAMIS data include those cases referred by UK Finance to the NFIB.
9. Remote purchase frauds refer to frauds where, in the vast majority of cases, card details have been fraudulently obtained through unsolicited emails or telephone calls or digital attacks, such as malware and data hacks, and then used to undertake fraudulent purchases over the internet, phone or by mail order. Remote purchase fraud is also known as “card-not-present (CNP) fraud”.
10. It is important to note that number of cases relates to the number of accounts defrauded, rather than the number of victims.
11. Further information on trends in payment industry fraud based on industry data collated by UK Finance is available in [Fraud the Facts 2017](#).
12. Data reported by UK Finance article [Finance industry stop £1.4 billion in attempted fraud](#).
13. For more information see the [report and consultation](#) published on 7 November 2017, explaining the work the PSR, the FCA and the payments industry have undertaken in the past year.

10 . Some types of offences involving theft are increasing

Since the mid-1990s, the Crime Survey for England and Wales (CSEW) has shown long-term reductions in most categories of theft, with the overall number of theft offences having fallen by 70% since the year ending December 1995. More recently, there is evidence of rises in some types of theft recorded by the CSEW, particularly in vehicle-related theft. Despite the CSEW showing no statistically significant change in burglary and robbery¹, recent rises in burglary recorded by the police are thought to indicate some genuine rises in this type of crime and changes are expected to be reflected in the survey in due course. It is also possible that recent increases in robbery recorded by the police indicate some real rises. Other types of theft offences that have seen increases recorded by the police may be more prone to changes in recording practices, making the picture less clear for these offences.

No change in overall theft measured by CSEW

The latest estimates from the CSEW showed no change in the overall number of theft offences in the year ending December 2017 compared with the previous year. However, vehicle-related theft has had a statistically significant change, increasing by 17% compared with the previous year (from 796,000 to 929,000 offences) ([Table A1](#)).

Rise in vehicle-related theft offences measured by the Crime Survey for England and Wales, but apparent rises in domestic burglary and robbery were not statistically significant

England and Wales, year ending December 1981 to year ending December 2017

Rise in vehicle-related theft offences measured by the Crime Survey for England and Wales, but apparent rises in domestic burglary and robbery were not statistically significant

England and Wales, year ending December 1981 to year ending December 2017

Source: Crime Survey for England and Wales, Office for National Statistics

Notes:

1. Crime Survey for England and Wales (CSEW) data on this chart refer to different time periods: 1981 to 1999 refer to crimes experienced in the calendar year (January to December); and from year ending March 2002 onwards the estimates relate to crimes experienced in the 12 months before interview, based on interviews carried out in that financial year (April to March).

Increase in vehicle-related theft

Within the overall 17% increase in vehicle-related theft estimated by the CESW in the latest year:

- “theft of vehicles” increased by 57% (from 57,000 to 89,000)
- “attempts of and from vehicles” increased by 28% (from 153,000 to 196,000)
- the higher volume offence of “theft from vehicles” showed no significant change

The CSEW increase in vehicle-related theft is supported by police recorded crime figures, which are thought to be fairly well recorded for this crime type, suggesting that the increase seen in police recorded crime reflects a genuine increase in this type of crime.

Police recorded vehicle offences increased by 16% in the year ending December 2017, continuing the rising trend seen over the last two years. There were increases in both theft of vehicles (up by 19% to 103,644 recorded offences) and theft from vehicles (up by 13% to 280,313 recorded offences). Recent rises are also evident in the number of motor insurance claims relating to theft².

However, the volume rises in both the CSEW and police recorded crime are relatively small in the context of the longer-term reduction in these offences, where CSEW vehicle-related theft has fallen by 78% since the year ending December 1995 and police recorded vehicle offences have decreased by 41% since the year ending March 2007.

Increases in burglary and robbery recorded by police are thought to reflect genuine increases

As well as vehicle-related offences, it is believed that increases in burglary recorded by the police are likely to reflect a genuine rise in this type of crime, which tends to be relatively well reported by the public and relatively well recorded by the police. The impact of recording improvements is thought to be less pronounced than for other types of crime.

Police recorded vehicle offences, burglary and robbery have shown increases in the last year, thought to reflect genuine increases

England and Wales, year ending March 2003 to year ending December 2017

Police recorded vehicle offences, burglary and robbery have shown increases in the last year, thought to reflect genuine increases

England and Wales, year ending March 2003 to year ending December 2017

Source: Police recorded crime, Home Office

Notes:

1. Police recorded crime data are not designated as National Statistics.

The number of burglary offences recorded by the police increased by 9% (from 404,216 to 438,971 offences), consistent with the rising trend seen over the previous year. The CSEW showed no change in burglary in the latest year, but it is limited in its ability to detect short-term trends. If the increase in burglary continues, we would expect this to be reflected in the survey in due course.

It is possible that recent rises in the number of robbery offences recorded by the police in the last year (up 33% from 55,892 to 74,130 offences), are also indicative of some real increases in this type of crime. However, recording improvements are also likely to have contributed to the rise. As it is a relatively low-volume crime, the CSEW does not provide a robust measure of short-term trends in robbery.

Crimes involving mopeds may have contributed to the increase in some types of theft

Robbery and theft from the person offences are disproportionately concentrated in London and other larger cities. In the latest year and similar to previous years, London accounted for 42% of all police recorded robbery and 48% of all police recorded theft from the person offences in England and Wales, compared with 17% across all crime types (excluding fraud). Data published by the Metropolitan Police³ suggest that in recent years robberies and thefts committed on mopeds have increased across London. Often the mopeds used to facilitate snatch thefts and robberies are also stolen; these vehicles have no or limited security, are less likely to have immobilisers and therefore become an easier target for thieves⁴. It is thought that the increase in these types of crimes may be a contributing factor to the rise seen in vehicle-related thefts, theft from the person and robbery offences.

Overview articles containing more detailed information on the long-term trends, on [bicycle theft](#), [vehicle-related theft](#), [robbery and theft from the person](#) and [burglary and other household theft](#) have previously been published.

Notes for: Some types of offences involving theft are increasing

1. Robbery, which is theft (or attempted theft) involving the use or threat of force, is included in this section as it involves theft, but it is not included in the “all theft” category.
2. Based on unpublished information from the Association of British Insurers (ABI).
3. Data obtained from a published [Freedom of Information request](#).
4. Evidenced in the Metropolitan Police’s [Be Safe](#) Campaign.

11 . What’s happened to the volume of crime recorded by the police?

For many types of offence, police recorded crime figures do not provide a reliable measure of trends in crime, but they do provide a good measure of the crime-related demand on the police.

This section provides more detailed information on the large increases seen in offences recorded by the police that are thought to be largely due to recording improvements or more victims reporting, rather than a genuine rise in crime.

Until recently the trend in the number of crimes recorded by the police has shown a broadly similar pattern to that seen in Crime Survey for England and Wales (CSEW) crime. Increases in the volume of crimes recorded were seen during the 1980s until the early 1990s. Changes to recording rules and processes resulted in rises between 1998 and 2004, followed by declining numbers of recorded crimes during the 2000s and early 2010s.

However, since 2014 the two sources have shown differing trends, with consistent increases in the number of crimes recorded by the police. The size of year-on-year increases has grown, with police recorded crime increasing by 7% in the year ending December 2015, by 9% in the year ending December 2016 and by 13% in the latest year.

The volume of crime being recorded by the police has increased over the last few years

England and Wales, year ending December 1981 to year ending December 2017

The volume of crime being recorded by the police has increased over the last few years

England and Wales, year ending December 1981 to year ending December 2017

Source: Police recorded crime, Home Office

Notes:

1. Police recorded crime data are not designated as National Statistics.
2. From the year ending March 2012 onwards, police recorded crime data have included offences from additional sources of fraud data.
3. Some forces have revised their data and police recorded crime totals may not agree with those previously published.

Rises seen over recent years reflect a combination of factors, which vary for different crime types as explained in other sections, including:

- continuing improvements to recording processes and practices
- more victims reporting crime
- genuine increases in crime

These factors are believed to have the largest impact on violent and sexual offences, since the [Crime-recording: making the victim count](#) report published by Her Majesty's Inspectorate of Constabulary & Fire and Rescue Services (HMICFRS) in November 2014 showed that violence against the person and sexual offences had the highest under-recording rates nationally (33% and 26%, respectively). Each of these types of crime are discussed in more detail in this section.

Recording improvements have had a big impact on police recorded violence

Ongoing work by police forces over the last three years to improve crime-recording practices has been an important driver of the increase in police recorded violence against the person offences, and this makes interpreting trends in police recorded violence difficult. Anecdotal evidence suggests that the improvements are thought to have had a larger effect on relatively less-harmful types of violent crime but to have had less of an impact on more harmful sub-categories, such as homicide and violent offences involving weapons.

Following the HMICFRS finding in 2014 that violent offences were more prone than other offences to subjective judgement about whether or not to record a crime, these offences have been one of the three main categories of crime focused on in the subsequent rolling programme of HMICFRS inspections.

The volume of violent crime being recorded by the police has increased over the last few years

England and Wales, year ending March 2003 to year ending December 2017

The volume of violent crime being recorded by the police has increased over the last few years

England and Wales, year ending March 2003 to year ending December 2017

November 2014: Publication of HMICFI Reports highlighting the issues in the recording practices for violent offences

Source: Police recorded crime, Home Office

Notes:

1. Police recorded crime data are not designated as National Statistics.

Evidence of improvements in recording since 2014 can be found in the more recent [Crime Data Integrity inspections](#) carried out by HMICFRS¹ in the last two years. However, the level of improvement varies between forces and some forces have further work to do to ensure reports of crime, in particular violent crime, are recorded correctly. Of the 20 published inspection reports, only five forces received a rating of “good”, with a further five rated as “requires improvement” and 10 rated as “inadequate”. Three forces rated as “inadequate” have since been re-inspected and their ratings improved, with two of these forces now receiving a rating of “good” and one being rated as “requires improvement”. It is therefore likely that the increases in police recorded violence as a result of improved recording could continue for some time. It is also possible that there have been some genuine increases in crime among the less serious categories at the same time as ongoing improvements to recording.

Additional data from the Metropolitan Police Service in the year ending June 2017 on the number of [calls for service](#) (for example, emergency and non-emergency calls from members of the public) relating to violent crime further suggests that the rise in recorded violence may be impacted by a greater proportion of reports of crime being recorded rather than a genuine rise. While the Metropolitan Police Service recorded a 3% increase in violence against the person offences in the year ending June 2017, the number of calls for service in relation to violent incidents decreased by around 2% over the same period.

Larger increase in violence without injury than violence with injury

The “violence without injury” sub-category, which accounted for 42% of all violence recorded by the police, showed a larger increase in the latest year to December 2017 (up 25% to 563,313 offences), than the “violence with injury” sub-category (up 11% to 505,244 offences).

Almost 9 in 10 violence without injury offences² recorded by the police in the year ending December 2017 were classified as assaults without injury³ (87%; 489,080 offences). This category showed a 26% increase (of 101,004 offences) compared with the previous year; which contributed to 90% of the increase in “violence without injury” offences. Smaller increases were seen in:

- threats to kill (up 4,635 offences; 4% of the increase)
- assault without injury on a constable (up 1,722 offences; 2% of the increase)
- modern slavery⁴ (up 1,395 offences; 1% of the increase)

Most of the 11% increase in the “violence with injury” sub-category (up from 456,880 to 505,244) is a result of an increase in assault with injury (77% of the increase). Assaults with intent to cause serious harm accounted for a further 7% of the increase (up 3,572 offences).

A substantial increase of 81% (598 offences) in the number of attempted murder offences in the latest year is largely due to the London and Manchester terror attacks, where the police recorded 56% of the rise (337 offences)⁵.

Stalking and harassment accounted for one-third of increase in violence

The stalking and harassment⁶ sub-category rose by 33% compared with the previous year, accounting for almost one-third of the change in violence recorded by the police (30%; 69,555 offences). It is likely that recording improvements are an important factor in this rise, particularly in relation to malicious communication offences due to improved compliance in recording of these new offences over time.

The [latest joint inspection](#)⁷ conducted by HMICFRS and HM Crown Prosecution Service Inspectorate (HMCPSI) found that stalking was not always recorded accurately by the police and in some of these cases, stalking was recorded as harassment. These findings suggest we cannot currently be confident about the accuracy of the recorded crime figures for the separate categories of stalking or harassment.

Changes in violence vary by police force area

Nearly all police forces recorded a rise in violence in the latest year to December 2017 compared with the previous year. It is important to bear in mind that these increases will reflect recording improvements and the extent of such effects differs across police forces ([Tables P1 and P2](#)). The largest percentage increases were seen for:

- Durham Constabulary (up 58% to 20,817 offences), who were inspected by HMICFRS during the first six months of 2017 and were rated as “good”
- Greater Manchester Police (up 53% to 91,506 offences), who were rated as “inadequate” by HMICFRS in August 2016 and as “requires improvement” in April 2018
- Kent Police (up 47% to 61,372 offences), who were rated as “inadequate” by HMICFRS in June 2017
- South Yorkshire Police (up 57% to 38,506 offences), who are yet to have a report published as part of the latest round of rolling inspections

City of London was the only police force to record a decrease in violence in the last year (down 5%).

Public order offences show increases

Public order offences cover a range of incidents including “causing intentional harassment, alarm or distress”. These offences are not covered by the CSEW and can be influenced by changes in police activity and recording practices. Public order offences increased by 42% in the last year following a 35% increase in the previous year. Recording improvements are thought to have impacted public order offences in a similar way to the related violence against the person offences. However, it is also possible that genuine increases in public disorder may have played a part in this rise.

Police recorded domestic abuse continues to rise

A 2015 [Her Majesty's Inspectorate of Constabulary & Fire and Rescue Services \(HMICFRS\) report](#) concluded that recent increases in the number of domestic abuse-related crimes were due, in part, to police forces improving their recording of domestic abuse incidents as crimes and to forces actively encouraging victims to come forward to report these crimes.

Since April 2015, crimes should be “flagged” as being domestic abuse-related by the police if the offence meets the government definition of domestic violence and abuse⁸.

Nearly one-third of violence against the person offences were flagged as domestic abuse-related by the police

England and Wales, year ending December 2017

Nearly one-third of violence against the person offences were flagged as domestic abuse-related by the police

England and Wales, year ending December 2017

Source: Police recorded crime, Home Office

Notes:

1. Police recorded crime data are not designated as National Statistics.
2. Data are provisional and have not been reconciled with police forces.

As the flagging of offences relies on a manual intervention in the crime recording system, the quality of these data may be inconsistent across police forces and open to more variation than the underlying number of recorded offences.

In the year ending December 2017, there was an increase in the number of domestic abuse-related offences recorded by the police (up 21% to 568,910 from 469,624). As well as general improvements in recording, the police may have improved their identification of which offences are domestic abuse-related and more victims may be coming forward to report these crimes. Given the different factors affecting the reporting and recording of these offences, we feel the police figures do not currently provide a reliable indication of current trends.

In comparison, figures from a self-completion module in the CSEW have shown little change in the prevalence of domestic abuse in recent years. However, the cumulative effect of these changes has resulted in a small, significantly lower prevalence for the year ending March 2017 (5.9%) compared with the year ending March 2012 (7.0%), indicating a gradual, longer-term downward trend ([Table S39](#)).

Further analysis on domestic abuse can be found in the [Domestic abuse in England and Wales, year ending March 2017](#) release and [Domestic abuse: findings from the Crime Survey for England and Wales: year ending March 2017](#).

Rises in police recorded sexual offences

There was an increase of 25% in the number of sexual offences recorded by the police in the year ending December 2017 compared with the previous year (up to 145,397, [Table A4](#)):

- police recorded rape increased by 31% (to 51,833 offences)
- other sexual offences increased by 22% (to 93,564 offences)
- sexual offences against children⁹ contributed around one-third (30%) to the total increase in the number of sexual offences recorded by the police

Police recorded sexual offences are at their highest volume since the introduction of the NCRS in 2002

England and Wales, year ending March 2003 to year ending December 2017

Police recorded sexual offences are at their highest volume since the introduction of the NCRS in 2002

Nov 2014: Publications of HMIC reports highlighting the issues in recording for sexual offences

England and Wales, year ending March 2003 to year ending December 2017

Source: Police recorded crime, Home Office

Notes:

1. Police recorded crime are not designated as National Statistics.
2. The Sexual Offences Act 2003, introduced in May 2004, altered the definition and coverage of sexual offences.

A factor in the latest rise is improvements made by the police in the recording of sexual offences. More recent [Crime Data Integrity inspections](#) carried out by HMICFRS¹⁰ indicate that there is evidence of improvements in the recording of sexual offences made by forces since 2014. However, the level of improvement varies between forces and some have further work to do to ensure that all reports of sexual offences are recorded correctly. Therefore, the increases seen as a result of improved recording may continue for some time.

An increased willingness of victims to come forward and report these crimes to the police is also thought to have contributed to the increase. High-profile coverage of sexual offences and the police response to reports of non-recent sexual offending are other factors that are likely to have influenced police recording of sexual offences. For example, Operation Yewtree, which began in 2012, and more recently, allegations against prominent individuals in Hollywood. Such operations are likely to have an ongoing influence on victims' willingness to come forward to report both recent and non-recent offences.

For a subset of forces providing data to the Home Office Data Hub, 26% of sexual offences recorded by the police in the year ending December 2017 were non-recent offences (those that took place more than 12 months before being recorded by the police). Non-recent offences increased by 25% compared with the year ending December 2016, in line with the overall increase over the same period. While non-recent offences remain an important contributor to the latest rise in sexual offences (26%¹¹), the rise was mainly due to increases in recent offences (those that took place within 12 months of being recorded by the police).

Given the different factors affecting the reporting and recording of these offences, we feel the police figures do not currently provide a reliable indication of current trends in these types of crime. Estimates from the CSEW for the year ending March 2017 showed that 2.0% of adults aged 16 to 59 years had been victims of sexual assaults in the last year (including attempted offences), no change from the previous year's estimate (2.0%). These figures have fluctuated between 1.5% and 2.4% since the survey year ending March 2009 ([Table S39](#)).

More information on interpreting longer-term trends in these offences can be found in [Sexual offences in England and Wales: year ending March 2017](#); however, this does not include the most recent statistics for the year ending December 2017.

Notes for: What's happened to the volume of crime recorded by the police?

1. These reports were published between 2016 and 2018, and the most recent reports were published on 15 February 2018. Three re-inspection reports were published on 10 April 2018.
2. Stalking and harassment offences are no longer included within the category of “violence without injury”.
3. Assaults without injury offences are those where at the most a feeling of touch or passing moment of pain is experienced by the victim.
4. Modern slavery can take multiple forms including sexual exploitation, forced labour and domestic servitude. Before 1 April 2015, modern slavery offences were recorded under trafficking for sexual exploitation, immigration offences, and other indictable or triable-either-way offences. As of 1 April 2015, a separately identifiable crime recording category of modern slavery was introduced. The [Modern Slavery Act 2015](#) consolidated existing slavery and trafficking offences into one Act. These provisions came into force on 31 July 2015.
5. These figures include crimes that occurred as part of the terrorist-related incident at Parsons Green Underground station in September 2017, which were not included in our year ending September 2017 bulletin due to a continuing investigation of the incident.
6. Stalking and harassment offences have moved out of the sub-category of “violence without injury” and are now in a separate sub-category along with the new notifiable offence of malicious communications. These are “disclosure of private sexual photographs and films (including on the internet) with the intent to cause distress or anxiety” and “sending letters (including emails) with intent to cause distress or anxiety”. These were added to the notifiable offence list in April 2015.
7. [Living in fear - the police and CPS response to harassment and stalking](#) inspection report was published in July 2017.
8. Any incident or pattern of incidents of controlling, coercive or threatening behaviour, violence or abuse between those aged 16 or over who are, or have been, intimate partners or family members regardless of gender or sexuality.
9. This includes “rape of a male or female child under 16”, “rape of a male or female child under 13”, “sexual assault on a male or female child under 13”, “sexual activity involving a child under 13 or under 16” and “abuse of children through sexual exploitation”.
10. These reports were published between 2016 and 2018, and the most recent reports were published on 15 February 2018. Three re-inspection reports were published on 10 April 2018.
11. Based on findings from the Home Office Data Hub (HODH) from a subset of forces.

12 . Other sources of data provide a fuller picture of crime

Crime Survey for England and Wales estimated 11 in 100 children aged 10 to 15 years were victims of crime

Crime Survey for England and Wales (CSEW) estimates of crimes experienced by children aged 10 to 15 years ([Appendix tables A9, A10, A11 and A12](#)) are not directly comparable with the main survey of adults, so are not included in the headline totals. However, estimates are presented to provide a better understanding of victimisation experiences among children resident in households. The CSEW estimated that around 11 in 100 children aged 10 to 15 years were victims of at least one crime in the latest survey year ending December 2017. A total of 660,000 crimes¹ were estimated to have been experienced by children aged 10 to 15 years:

- 46% were violent crimes (303,000), with the majority of these being low-level violence ²
- 39% were thefts of personal property (259,000)
- 8% were criminal damage to personal property (52,000)
- 7% were robbery (45,000)

Given the small sample size for the 10-to-15-year-old element of the CSEW, estimates can fluctuate over time and trends can be difficult to interpret.

Other sources of data

Neither the CSEW nor the main police recorded crime series cover all crime and other sources of information are used where available to help provide a fuller picture.

Decrease in anti-social behaviour recorded by police

Around 1.7 million incidents of anti-social behaviour (ASB) were recorded by the police (including the British Transport Police³) in the latest year, a decrease of 6% from the previous year ([Figure F1](#)). These are incidents that may still be crimes in law, such as littering or dog fouling, but are not severe enough to result in the recording of a notifiable offence and therefore are not included in the main police recorded crime series. There have been no recent inspections into ASB, however, [a review by Her Majesty's Inspectorate of Constabulary & Fire and Rescue Services \(HMICFRS\)](#) in 2012 found that there was a wide variation in the quality of decision-making associated with the recording of ASB. As a result, ASB incident data should be interpreted with caution. It is possible that, given the focus on the quality of crime recording, some incidents that may previously have been recorded as ASB have more recently been recorded as crimes.

The CSEW estimated that 32% of respondents experienced or witnessed ASB in their local area in the latest survey year. While this is a statistically significant increase from the 29% found in the previous survey year, this estimate has remained at a similar level (between 27% and 32%) since the data were first collected in the survey year ending March 2012. Further information is available in [Figures F1 and F2](#), and [Tables F6 and F7](#).

Non-notifiable offences remain at similar level to previous year

In the year ending September 2017 (the latest period for which data are available), there were 1.1 million convictions for non-notifiable offences⁴ that were not covered in police recorded crime or the CSEW, similar to the number seen in the previous year.

In addition, 13,000 Penalty Notices for Disorder (PNDs) were issued in relation to non-notifiable offences for the year ending September 2017, a decrease of 24% from the year ending September 2016; the majority of these PNDs related to drunk and disorderly behaviour⁵. Further information is available in [Tables F8a and F8b](#).

Wholesale and retail businesses experienced the highest levels of crime

As the CSEW is a survey of the population resident in households, it traditionally has not covered crimes against businesses⁶. Additionally, the police recorded crime series can only provide a partial picture of crimes against the business community as not all offences come to the attention of the police. The [Commercial Victimisation Survey \(CVS\)](#) provides estimates of crime against selected business premises⁷ covered in its sample and gives some insight into the number of these crimes that go unreported to the police.

The 2016 CVS⁸ showed that businesses in the wholesale and retail sector experienced the highest levels of crime – an estimated 5.2 million incidents, a rate of around 13,000 incidents per 1,000 business premises. However, the CVS does not cover all industry sectors (the survey generally covers premises in three or four industrial sectors each year) and the small sample sizes associated with individual sectors mean that caution must be applied when comparing crime rates over time.

Notes for: Other sources of data provide a fuller picture of crime

1. The survey of children aged 10 to 15 years only covers personal level crime (so excludes household level crime) and, as with the main survey, does not include sexual offences.
2. 81% of violent crimes experienced in the latest survey year resulted in minor or no injury.
3. It is not possible to look at longer trends in ASB including British Transport Police, as data are only available from the year ending March 2013.
4. Non-notifiable offences are offences dealt with exclusively by magistrates' courts or by the police issuing of a Penalty Notice for Disorder or a Fixed Penalty Notice. Along with non-notifiable offences dealt with by the police (such as speeding), these include many offences that may be dealt with by other agencies – for example, prosecutions by TV Licensing, or the Driver and Vehicle Licensing Agency (DVLA) for vehicle registration offences.
5. A pilot scheme was implemented from November 2014 in Leicestershire, Staffordshire and West Yorkshire police forces to reduce the types of out-of-court disposals available for adult offenders, including limiting their use of Penalty Notices for Disorder (PND). In the pilot areas, the only out-of-court disposals available are community resolutions and conditional cautions. Since the pilot ended in November 2015, these three forces have continued with their limited use of out-of-court disposals and some other forces have also adopted similar policies. This is likely to have been a factor in the declining number of PNDs issued.
6. Although the recent extension to cover fraud against adults resident in households includes incidents where the victim has been fully (or partially) reimbursed by their financial provider.
7. This is a premises-based survey; respondents were asked if the business at their current premises had experienced any of a range of crime types in the 12 months prior to interview.
8. Data from the 2016 CVS are the latest data available. Results from the 2017 CVS are due to be published by the Home Office on 3 May 2018.

13 . New and upcoming changes to this bulletin

[Improving crime statistics for England and Wales – progress update](#) provides an overview of our plans to improve the design, coverage and presentation of crime statistics in England and Wales over the next few years. In addition, details of a number of specific changes are outlined in this section, including changes to the categorisation of police recorded crime and changes to the Crime Survey for England and Wales (CSEW).

National Statistics status of fraud and computer misuse

Estimates of fraud and computer misuse were previously classed as Experimental Statistics. Following assessment by the Office for Statistics Regulation in March 2018, they have now been classified as National Statistics.

Changes to the categorisation of police recorded crime

New subcategories of “violence against the person” were first introduced in the quarterly bulletin [Crime in England and Wales: year ending June 2017](#).

“Death or serious injury caused by unlawful driving” has been created to include the following:

- causing death or serious injury by dangerous driving (4.4)
- causing death by careless driving when under the influence of drink or drugs (4.6)
- causing death by careless or inconsiderate driving (4.8)
- causing death by driving: unlicensed or disqualified or uninsured drivers (4.9)

These offences were previously included within the subcategory of violence with injury.

“Stalking and harassment” has been created to include:

- harassment (8L and 8M)
- stalking (8Q)
- malicious communications (8R), which came into effect from April 2017

Stalking and harassment offences were previously included within the subcategory of violence without injury. For malicious communications, only data for the period April to December 2017 are presented in this bulletin as there was no central collection of these data in the preceding nine months.

Additionally, since January 2018, the [appendix tables](#) accompanying this release provide a more detailed breakdown of homicide offences than has previously been provided. Separate figures are given for each of the constituent categories of homicide: murder, manslaughter, corporate manslaughter and infanticide.

Figures given in this breakdown of police recorded homicide will differ from those sourced from the Home Office Homicide Index¹ because of an important distinction between the two data sources. Police recorded crime data on homicide (as presented in this release) represent the recording decision of the police based on the available information at the time the offence comes to their attention. In contrast, Homicide Index data take account of the charging decision and court outcome in cases that have gone to trial. It is common for offences initially recorded as murder by the police to be charged or convicted as manslaughter at court. As a result, manslaughter consistently makes up a notably higher proportion of offences in the Homicide Index compared with police recorded crime.

Crime Severity Score

[Experimental Statistics](#) on a newly developed [Crime Severity Score](#) (CSS) have been released alongside this bulletin. The CSS has been developed as an additional measure to supplement existing Office for National Statistics (ONS) statistics on crime. This new measure weights different types of crime according to severity, with more serious crimes carrying a higher weight to better reflect the level of harm to society and demand on the police caused by crime.

[Initial research outputs](#) based upon the CSS were published in November 2016, along with a request for feedback from users. We now issue an updated CSS dataset alongside each quarterly crime statistics bulletin.

Changes to the Crime Survey for England and Wales

From April 2018, a number of changes have been made to the CSEW following a review of the best approach for mitigating public sector financial constraints on the future level of funding for the survey. These follow on from initial proposals published in a [consultation response paper](#) in October 2017. Small reductions have been made in the survey's sample size and target response rate and a series of questions related to the criminal justice system have been removed from the questionnaire.

Downloading bulletin tables

Bulletin tables that were previously accessible in a separate set of data tables alongside the bulletin will no longer be published. All tables can be downloaded from within this bulletin. Additionally, tables on further data sources including non-notifiable offences, anti-social behaviour and the Commercial Victimization Survey that were previously published as "former bulletin tables" are now published as "other related data tables".

CSEW module on plastic card fraud

Separate questions limited to fraud on plastic cards (bank and credit cards) have been included in a supplementary module of the CSEW since 2005. These questions continued to be included in the survey while the new questions on fraud and computer misuse were bedded in, but were removed from the questionnaire in October 2017 when the new questions were expanded to the full survey sample. All future estimates relating to bank and credit card fraud will be calculated using data from the new questions. For more information see the [Overview of fraud and computer misuse statistics](#) article.

Delay to publication of user guide tables

A set of accompanying tables are published alongside our [User guide](#) on an annual basis. These tables are usually published alongside our year ending March bulletin in July. However, the tables for the year ending March 2018 will not be published until October 2018 while we implement a change to our method for handling repeat victimisation. More information on this change can be found in [Improving crime statistics for England and Wales – progress update](#).

Feedback

We've made a number of changes to this bulletin to improve the clarity of the main messages. We welcome feedback on this new format quarterly bulletin at crimestatistics@ons.gov.uk.

Notes for: New changes to this bulletin

1. These figures are published annually by ONS and were last released in [Homicide in England and Wales: year ending March 2017](#).

14 . Quality and methodology

The Crime in England and Wales quarterly releases are produced in partnership with the Home Office who collate and quality assure the police recorded crime data presented in the bulletins. Home Office colleagues also quality assure the overall content of the bulletin.

[National Statistics](#) are produced to high professional standards set out in the [Code of Practice for Statistics](#). They undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political interference.

The [UK Statistics Authority](#) has designated this statistical bulletin as a National Statistics output, in accordance with the [Statistics and Registration Service Act 2007](#) and signifying compliance with the [Code of Practice for Statistics](#).

However, statistics based on police recorded crime data have been assessed against the Code of Practice for Statistics and found not to meet the required standard for designation as National Statistics. The [full assessment report](#) can be found on the UK Statistics Authority website.

A new data quality framework has been compiled to help inform users about the quality of crime statistics for different types of crime and which source is thought to provide the most reliable measure. This can be found in Chapter 5 of the [User guide](#).

Table 7 summarises the strengths and weaknesses of the two main sources of data used in this bulletin.

Table 7: Strengths and limitations of the Crime Survey for England and Wales and police recorded crime

Crime Survey for England and Wales	Police recorded crime
Strengths	Strengths
Large nationally representative sample survey that provides a good measure of long-term crime trends for the offences and the population it covers (that is, those resident in households)	Has wider offence coverage and population coverage than the CSEW
Consistent methodology over time	Good measure of offences that are well-reported to and well-recorded by the police
Covers crimes not reported to the police and is not affected by changes in police recording practice; therefore, is a reliable measure of long-term trends	Primary source of local crime statistics and for lower-volume crimes (for example, homicide)
Coverage of survey extended in 2009 to include children aged 10 to 15 years resident in households	Provides whole counts (rather than estimates that are subject to sampling variation)
Independent collection of crime figures	Time lag between occurrence of crime and reporting results tends to be short, providing an indication of emerging trends
Limitations	Limitations
Survey is subject to error associated with sampling and respondents recalling past events	Excludes offences that are not reported to, or not recorded by, the police and does not include less serious offences dealt with by magistrates' courts (for example, motoring offences)
Potential time lag between occurrence of crime and survey data collection means that the survey is not a good measure of emerging trends	Trends can be influenced by changes in recording practices or police activity as well as public reporting of crime
Excludes crimes against businesses and those not resident in households (for example, residents of institutions and visitors)	Not possible to make long-term comparisons due to fundamental changes in recording practice introduced in 1998 and the year ending March 2003 ²
Headline estimates exclude offences that are difficult to estimate robustly (such as sexual offences) or that have no victim who can be interviewed (for example, homicides and drug offences)	There are concerns about the quality of recording – crimes may not be recorded consistently across police forces and so the true level of recorded crime may be understated
Previously excluded fraud and cybercrime ¹	

Source: Office for National Statistics

Notes:

1. From 1 October 2015, the offence coverage of the CSEW was extended to include fraud experienced by the adult population. Estimates from these new questions were published for the first time in the "Crime in England and Wales, year ending March 2016" release.

2. Section 3.3 of the User Guide has more information

The [Crime in England and Wales Quality and Methodology Information](#) report contains important information on:

- the strengths and limitations of the data and how it compares with related data
- uses and users of the data
- how the output was created
- the quality of the output including the accuracy of the data

Unless stated otherwise, all changes in Crime Survey for England and Wales (CSEW) estimates described in the main text are statistically significant at the 5% level. Since the CSEW estimates are based on a sample survey, it is good practice to publish confidence intervals alongside them; these provide a measure of the reliability of the estimates and can be found in the [User guide tables](#). Further information on statistical significance can be found in Chapter 8 of the [User guide](#).

More information regarding the coverage, coherence and accuracy of the CSEW and police recorded crime can be found in the [User guide to crime statistics for England and Wales](#), the [Crime in England and Wales Quality and Methodology Information report](#) and (for CSEW only) the [CSEW technical report](#).
